

# Refinzi Founder Operating System (v1)

## Mission

Build a category-defining Ambient AI Interaction Layer with the minimum possible waste of founder time, capital, engineering effort, and AI credits.

Every decision should maximize:

Long-term product value ÷ (Time + Cost + Complexity + Maintenance + Debugging Risk)

---

## Principle 1

### Build moats, not demos.

Prioritize:

1. Output Intelligence Engine
2. Universal AI Compatibility
3. Privacy-first Learning Engine
4. Context Graph

Deprioritize:

- Visual polish
  - Fancy animations
  - Complex settings
  - Non-essential UI
- 

## Principle 2

### Architecture before implementation.

Every feature follows:

Vision → Product Fit → Roadmap Phase → Architecture → Implementation Plan → Code

No exceptions.

---

## Principle 3

### Evidence before debugging.

Never debug assumptions.

Always follow:

Can it be reproduced? → Did it ever exist? → Git evidence? → Root cause? → Fix

Never rebuild imaginary systems.

---

## Principle 4

### One task. One outcome.

Engineering tasks must be atomic.

Bad:

"Build Output Engine and think about XML."

Good:

"Create compiler.js, stages.js and types.js."

---

## Principle 5

### Every feature belongs to a roadmap phase.

P0

- Clipboard
- BYOK
- Toast
- Universal AI

P1

- Output Intelligence Engine

P2

- Intent Library

P3

- Ambient Trigger Layer

P4

- Learning Engine

P5

- Privacy-first Context Graph

Features from later phases should not consume current engineering cycles.

---

## Principle 6

### Zero-cost company by default.

Prefer:

- Local execution
- BYOK
- No backend
- No cloud storage
- No infrastructure
- No support burden

Every server introduced must justify its lifetime cost.

---

## Principle 7

### Preserve optionality.

Avoid provider lock-in.

Refinzi targets:

Human Intent ↓ Refinzi IR ↓ Any Intelligence

Never build directly around one AI vendor.

---

## Principle 8

### **Founder energy is the scarcest resource.**

Avoid:

- Endless debugging
- Architectural rewrites
- Gold plating
- Premature optimization

Shipping beats polishing.

---

## Principle 9

### **Build invisible intelligence.**

Users should never learn prompt engineering.

Users should think:

"I wrote naturally."

Refinzi should silently do the hard work.

---

## Principle 10

### **Optimize for 10x output quality, not 10x features.**

A product that consistently improves AI results wins.

A product with many features but average outputs loses.
