

The Refinzi Intelligence Engine

The Intelligence Engine is the core system that helps AI understand the user.

Rather than storing raw documents or conversations, it gradually builds an understanding of how the user thinks and works.

The engine continuously improves through lightweight behavioral signals.

How It Works

User Behavior

+

Template Choices

+

Acceptance Signals

Better First Answers

User Behavior

The engine observes interaction patterns.

Examples:

- Which workflows are used most often.

- Whether the user prefers Click ✨ or Hold ✨.
 - Which AI providers are selected.
 - Which expert workflows become habits.
-

Template Choices

The engine learns which thinking frameworks the user naturally trusts.

Examples:

- GTM Strategy
- Executive Communication
- Product Requirements
- First Principles Thinking
- Investor Updates

These choices help build a profile of how the user approaches problems.

Acceptance Signals

Instead of learning from private documents, the engine learns from outcomes.

Examples:

- User accepts generated context immediately.
- User makes significant edits.
- User retries using another workflow.
- User repeatedly chooses the same expert template.

Over time the engine understands what a successful first answer looks like for that individual.

Local Preferences

Personalization happens locally whenever possible.

Examples:

- Preferred writing style
- Communication tone
- Output structure
- Response length
- Favorite frameworks

The goal is not to remember what users write.

The goal is to remember how they think.

Privacy First

Refinzi does not need to store your documents to become useful.

The Intelligence Engine learns from patterns, preferences, and behavior—not from building a copy of your private data.

Long-Term Vision

Today:

AI understands language.

Tomorrow:

AI understands intent.

Eventually:

The Refinzi Intelligence Engine becomes your portable AI memory layer, helping every model work the way you work.
